

2005 NATA issues and updates

The following list provides some of the known issues and updates that were not addressed during the review of the 2005 NATA. The timing of the analysis and review and the availability of resources did not allow these changes to be incorporated into the final 2005 NATA results. Reviewing this list will provide a better understanding of the results in the locations specified and help in determining how best to use these results.

Issue	#1
Location:	State of Virginia
Issue:	Emission estimates for arsenic for SCC 2102002000, Industrial Coal Combustion, were too high. A recalculation of emissions shows arsenic emissions to be about an order of magnitude lower than those include in the 2005 NATA.
Impact:	Estimates of cancer risks should be 8-15 in a million lower in most locations than those depicted in the results.
